Hyperkalemia (High Blood Potassium): Hyperkalemia is high potassium in the blood. Causes of hyperkalemia include diseases of the kidneys or adrenal glands, or some medications. Symptoms including muscle weakness, fatigue, tingling, or nausea may not appear until levels of potassium are extremely high. Treatment depends on the severity of symptoms.

### **Hyperkalemia (High Blood Potassium) Topic Guide**

Often a report of high blood potassium isn't true hyperkalemia. Instead, it may be caused by the rupture of blood cells in the blood sample during or shortly after the blood draw. The ruptured cells leak their potassium into the sample.

Hyperkalemia is the medical term that describes a potassium level in your blood that's higher than normal. Potassium is a chemical that is critical to the function of nerve and muscle cells, including those in your heart. Your blood potassium level is normally 3.6 to 5.2 millimoles per liter (mmol/L).

### **High potassium (hyperkalemia) - Mayo Clinic**

Mild hypokalemia (serum potassium 3 to 3.5 mEq/L) rarely causes symptoms. Serum potassium < 3 mEq/L generally causes muscle weakness and may lead to paralysis and respiratory failure. Other muscular dysfunction includes cramping, fasciculations, paralytic ileus, hypoventilation, hypotension, tetany, and rhabdomyolysis.

### **Hypokalemia - Endocrine and Metabolic Disorders - MSD ...**

Hyperkalemia or high blood potassium is a condition caused by abnormally high levels of potassium in the blood. Symptoms of hyperkalemia include nausea, muscle weakness, and tingling sensations. Medications and certain medical conditions cause hyperkalemia, which can then cause kidney failure, cardiac arrest, or death.
